> IGS Workshop Session #08: Orbit Modelling 03–07. July 2017, Paris, France

Overview

Motivation

Investigating indicators for orbit characteristics

Estimating satellite antenna offsets

Applying the estimated satellite antenna offsets

Discussion and summary

PS07-10: U. Meyer, Y. Jean, D. Arnold, A. Jäggi

EGSIEM: scientific combination service for monthly gravity fields

GNSS Reprocessing in 2015:

Product availablity:

GPS GLONASS

GNSS satellite orbits: since 1994 since 2002

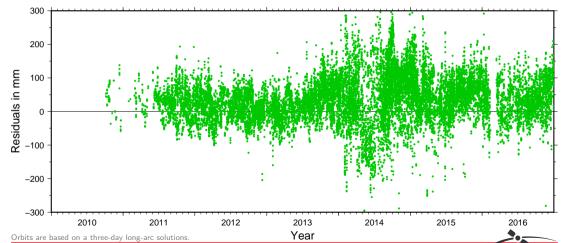

GNSS satellite clock corrections:

sampling $30 \, \mathrm{s}$: since 2000 since 2008 sampling $5 \, \mathrm{s}$: since 2003 since 2010

PS08-04: A. Sušnik, D. Arnold, A. Villiger, R. Dach, A. Jäggi Validating EGSIEM Reprocessing Products by LEO POD and PPP

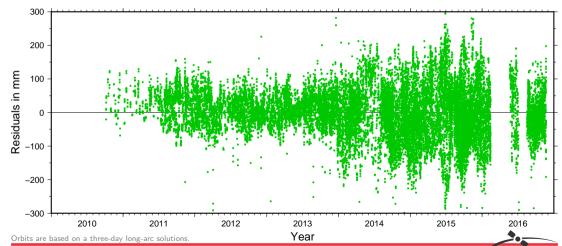

SLR residuals for satellite SVN 736 (R09/R16)

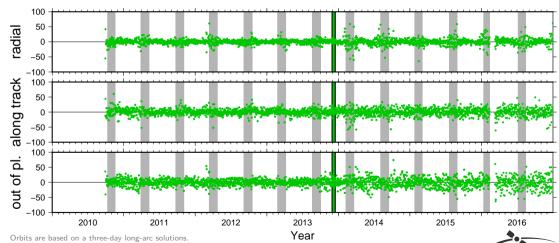

Dach et al.: GLONASS Satellite Orbit Mod S Workshop, 03–07. July 2017, Paris, Franc

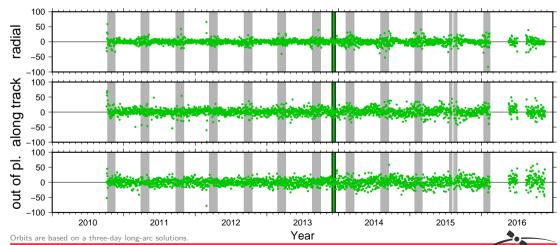

SLR residuals for satellite SVN 737 (R12)

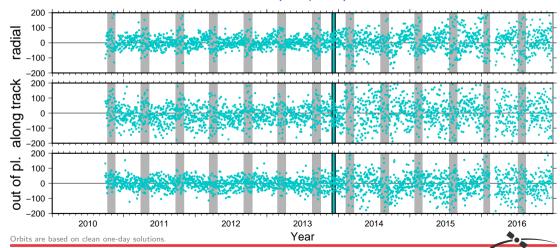

Orbit misclosures for satellite SVN 736 (R09/R16) in mm

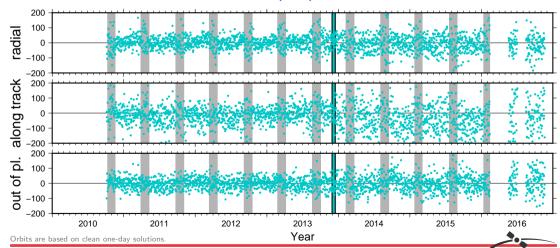

Orbit misclosures for satellite SVN 737 (R12) in mm

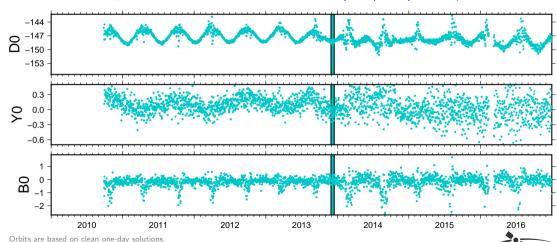

Orbit misclosures for satellite SVN 736 (R09/R16) in mm

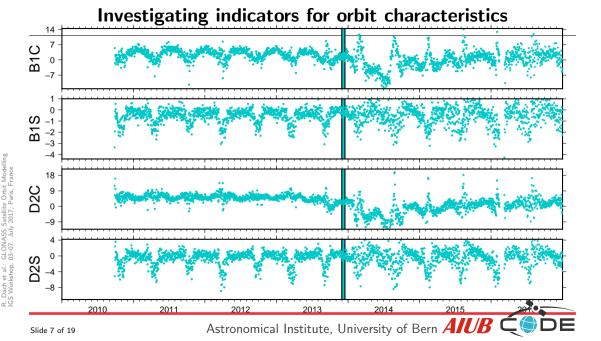

Orbit misclosures for satellite SVN 737 (R12) in mm

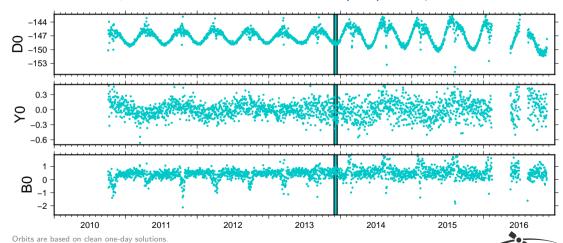

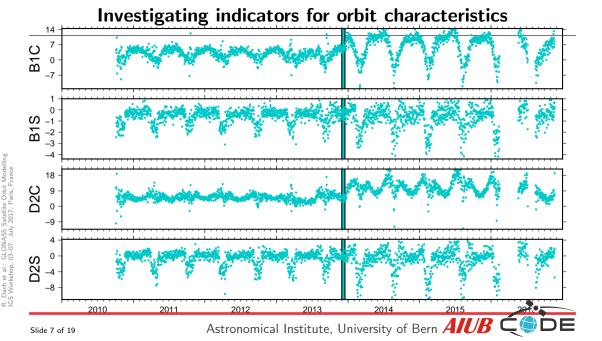

Estimated SRP parameters for satellite SVN 736 (R09/R16) in $\mathrm{nm/s^2}$

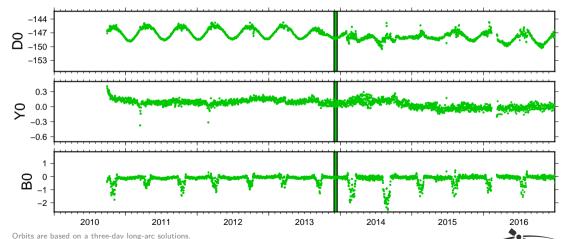

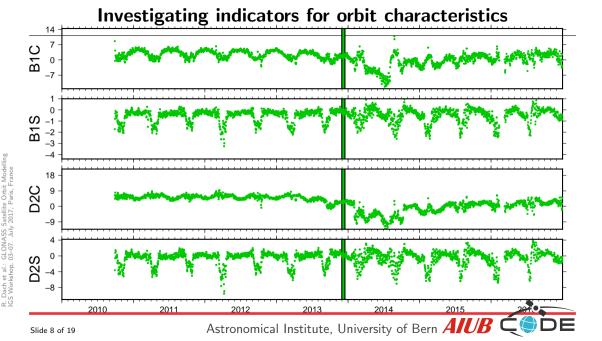

Estimated SRP parameters for satellite SVN 737 (R12) in $\mathrm{nm/s^2}$

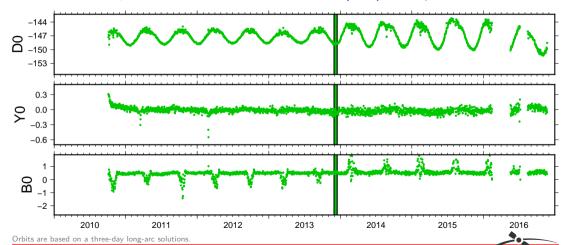

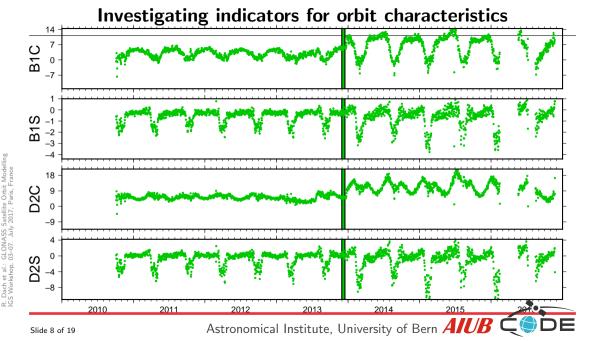

Estimated SRP parameters for satellite SVN 736 (R09/R16) in $\mathrm{nm/s^2}$

Estimated SRP parameters for satellite SVN 737 (R12) in $\mathrm{nm/s^2}$

- Some of the GLONASS satellites show unexpected big SLR residuals after a few vears of lifetime.
 - Some satellites had to be excluded from the SLR-validation in the paper Arnold et al., 2015 because of unexpected behaviour.

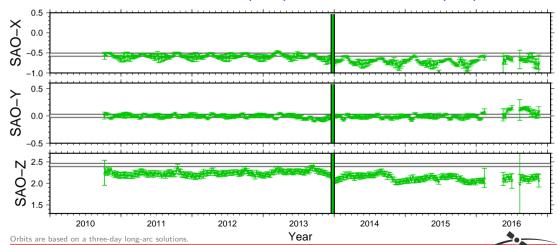

- Some of the GLONASS satellites show unexpected big SLR residuals after a few years of lifetime.
 - Some satellites had to be excluded from the SLR-validation in the paper Arnold et al., 2015 because of unexpected behaviour.
- Orbit misclosures do only marginally react on this phenomena for three-day arc.
 A bigger effect is visible for one-day arcs.

- Some of the GLONASS satellites show unexpected big SLR residuals after a few years of lifetime.
 - Some satellites had to be excluded from the SLR-validation in the paper Arnold et al., 2015 because of unexpected behaviour.
- Orbit misclosures do only marginally react on this phenomena for three-day arc.
 A bigger effect is visible for one-day arcs.
- The SRP parameters show a clear deviation from the usual pattern in these periods.

- Some of the GLONASS satellites show unexpected big SLR residuals after a few years of lifetime.
 - Some satellites had to be excluded from the SLR-validation in the paper Arnold et al., 2015 because of unexpected behaviour.
- Orbit misclosures do only marginally react on this phenomena for three-day arc.
 A bigger effect is visible for one-day arcs.
- The SRP parameters show a clear deviation from the usual pattern in these periods.
- The shown effects are more pronnounced in the ECOM2 than with the classical ECOM (periodic terms in *D*-direction added).

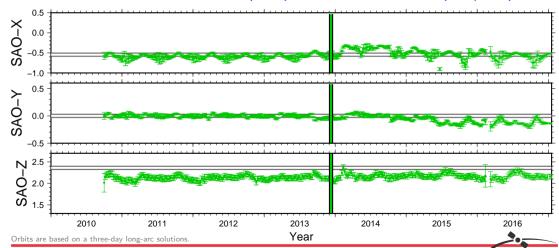

Estimated satellite antenna offsets (SAO) for satellite SVN 737 (R12) in m

SLR residuals for satellite SVN 735 (R05)

Quantile 25%, 50%, and 75% of SLR residuals per year in mm

Orbits are based on a three-day long-arc solutions.

ch et al.: GLONASS Satellite Orbit Modelli /orkshop, 03–07. July 2017, Paris, France

Discussion and summary

What could be the reason at the spacecraft?

Shift of the center of mass:

If the satellite has roughly a mass of 1500 kg, 150 kg need to be shifted by 1 m in order to generate a COM shift of 10 cm.

http://spaceflight101.com/spacecraft/glonass-m/

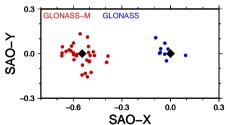

Discussion and summary

What could be the reason at the spacecraft?

Issue with satellite antenna:

Not likely because SAO-Z is not affected in most cases and the SAO- $\rm X/Y$ estimates do not show a pattern

http://spaceflight101.com/spacecraft/glonass-m/

Dach et al.: GLONASS Satellite Orbit Modellir Workshop, 03–07. July 2017, Paris, France

Discussion and summary

What could be the reason at the spacecraft?

Satellite attitude misorientation:

The satellite plane with the navigation antenna and the SLR reflector is about 2 m away from the center of mass.

A shift of 10 to 15 cm results in a tilt of the 3 to 4 degree of the satellite body.

http://spaceflight101.com/spacecraft/glonass-m/

Dach et al.: GLONASS Satellite Orbit Modelli S Workshop, 03–07. July 2017, Paris, France

Discussion and summary

What could be the reason at the spacecraft?

- Shift of the center of mass:
 If the satellite has roughly a mass of 1500 kg, 150 kg need to be shifted by 1 m in order to generate a COM shift of 10 cm.
- Issue with satellite antenna:
 Not likely because SAO-Z is not affected in most cases and the SAO-X/Y estimates do not show a pattern
- Satellite attitude misorientation:
 The satellite plane with the navigation antenna and the SLR reflector is about 2 m away from the center of mass.
 - A shift of 10 to 15 cm results in a tilt of the 3 to 4 degree of the satellite body.

Discussion and summary

What could be the reason at the spacecraft?

- Shift of the center of mass: If the satellite has roughly a mass of 1500 kg, 150 kg need to be shifted by 1 m in order to generate a COM shift of 10 cm.
- Issue with satellite antenna: Not likely because SAO-Z is not affected in most cases and the SAO-X/Y estimates do not show a pattern
- Satellite attitude misorientation:

The satellite plane with the navigation antenna and the SLR reflector is about 2 m away from the center of mass.

A shift of 10 to 15 cm results in a tilt of the 3 to 4 degree of the satellite body.

The usage of the estimated SAOs obviously helps to reduce the SLR residuals.
